Stacking Jar Tower

Four jars that screw into one another, a foot below and a cap on top. The thread is the test print's 0.2 mm one, the snug one you picked.

1 What you print

- **4 jars (the same file 4 times), 1 cap, 1 foot. Pick any colours.**
- **Jar: prints standing on its teeth, as the test spigot did.**
- **Cap: prints upside down, its flat top on the plate.**
- Foot: prints as it stands, its wide skirt on the plate.

2 Build it from the bottom

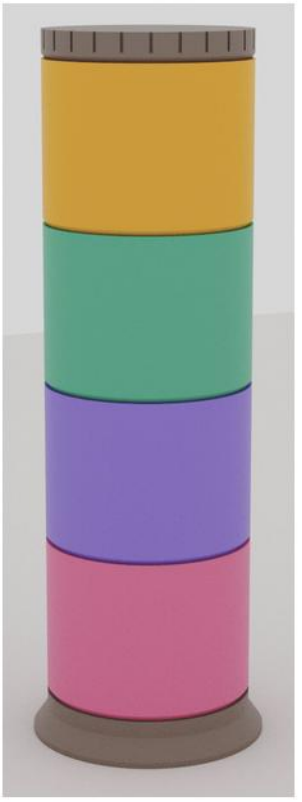

- **Foot on the table. Screw a jar into it, teeth down, turning clockwise.**
- Each jar stops when its cone lands in the mouth below: snug it there, don't force past it.
- Then the next jar into that one's top, and so on. The cap goes on last.

Design-review renders of the real parts, not photos. Colours are only to tell the parts apart.

Stacking Jar Tower: built

About 25 cm tall with all four jars. Each jar holds about 150 ml.

3 The tower

- Any jar opens by unscrewing everything above it.
- Use fewer jars for a shorter tower: the cap fits any jar, and any jar fits the foot.

4 Inside a joint

- Cut in half: the teeth engaged and the cone closing the seam.

Stacking Jar Tower: test it

Check each joint as you build it.

5 For every joint

- **Screws in by hand, smooth, all the way to the stop?**
- Screwed home, wiggle it: any play?
- Pick the tower up by the cap: does everything come with it?
- Unscrew a middle jar and screw it back: same feel as the first time?

Good

- Every joint feels like test mouth 1.
- No wobble; the seams close all round.
- Lifting by the cap lifts the whole tower.

Tell me

- any joint that binds, or goes on crooked;
- any that wobbles when home;
- if a jar's floor or a seam lets light through;
- how it looks from across the room.
